

# Domestic Wastewater Treatment System

## Abstract

A method for treating domestic wastewater, in situ, in a single tank. The use of which obviates the need for traditional septic tanks as well as lessening the burden, and reliance on, central water treatment plants. The resulting water is stored for non-potable reuse, thus lessening impact on public water supplies for domestic-utility use. The method is not limited to residential use but is equally applicable to boats, recreational vehicles, hotels, resorts, clubs, rest areas, apartment complexes, and the like.
